Introduction

Welcome to the 3rd edition of *Building Green Guide: Sustainable Product Choices*. This guide is designed to inform homeowners and building professionals about sustainable or “green” building materials. It is a tool to help you identify and find green building products that are healthy for your family and mindful of the environment. They pay for themselves with interest.

Green building materials and products meet one or more broad standards:

- they have minimal environmental and health impacts in their life cycle from extraction to manufacturing and transport to disposal;
- they reduce environmental impacts during construction, remodeling and demolition;
- they reduce environmental impacts of building operation and maintenance; and
- they contribute to healthy indoor air and environmental quality.

Green building products are: low or nontoxic, reused and refurbished, contain recycled and agricultural materials, are sustainably harvested, and reduce energy, material and water use.

There are thousands of such green, resource efficient building materials available for your use today. The *Building Green Guide* primarily lists those available through Wisconsin retailers and distributors and those in neighboring states. For completeness, some types of green products not locally available but available through the manufacturer or a distant retailer are listed as well.

Any project can be done green, from a simple floor replacement to a house remodel or new construction. This guide includes green structural, interior and exterior products for any size project and a range of budgets. It also contains sources of services and information. You can purchase green products yourself if you are working on your own home project or work with your builder and architect and request that he/she use resource efficient materials. Share this list with your contractor. Many builders will build green if their clients request it.

How to use this guide

The *Building Green Guide*, while it can be printed, is designed to be used on the web as a searchable database. Click on the “Bookmarks” tab at the left margin of your screen to link to the page of any division and the “+” box to the left of the division name to link to the subcategories so that you can view a list of individual products, their green attributes, and manufacturer & retailer (or distributor) contact information. Also, by selecting *Search* on the *Edit* menu, you can search the entire document for any word or phrase such as a specific product name, retailer, or location. All links in the guide are live and will take you to the referenced website by clicking on them. Feel free to print individual pages to take to the store with you. By not printing the entire *Guide*, we’re helping to save trees and paper.

While designed for the homeowner, the listing follows a format used by the design and building trades called the CSI Code (Construction Specifications Institute). It is a nationally recognized organizational framework for building products and projects that has been slightly modified here for general public user-friendliness. Broad product categories are called divisions and are numbered and titled. There are 16 divisions each containing a number of categories. Divisions 1 and 14 do not pertain to products so are not included in this guide, neither are divisions 5 and 10 which are not applicable to houses.

You will find that many manufacturers (M), distributors (D), and retailers (R) are listed multiple times. Given that, each company that is repeated within a division is assigned a number and their contact information is listed only the first time the company is referenced within a division category. When the company is repeated, their number is provided to direct you to their first full listing within the division. By clicking on that number, you will be brought to the page where the company is first listed in the division.

Also, included in the back of the *Guide* is a glossary of terms for your use. *Building Green Guide: Sustainable Building Products* is a companion to *Building Green: A consumer's guide to sustainable building* (Gruder, 1999). Reading the *consumers' guide* will help you to put green purchasing into the larger context of green building, and to plan your project with greater effectiveness in relation to site, energy, water and material efficiency, and a healthy indoor environment.

The *Building Green Guide* is designed to help you meet your needs while leaving resources and a cleaner environment for your children and their children. You are building green for the future. *Green building is easier on your health, your pocketbook and our environment!*

NOTE: If you find a building material locally you think is green and is not listed or a retailer that carries one of the listed products but is not included, please let us know. Send the information to shwec@uwm.wisc.edu.

<h3 style="margin: 0;">DIVISION 2: SITE</h3> <p style="margin: 0;">Trees are the best management practice for conserving water and maintaining natural water flows on site. Other approaches include using vegetation on the roof and at grade, using porous paving to increase infiltration into the ground, and reusing rain water. Small house footprints will also reduce runoff. Site considerations also include water efficient landscaping and using natural, reused, and recycled materials for outdoor structures and furnishings.</p>				
<h3 style="margin: 0;">EROSION CONTROL</h3>				
<p>COMPOST Compost can be used as an erosion barrier by applying a layer of compost around the edges of a construction site the way silt fences are used. EPA is currently researching this as a best management practice for erosion control and stormwater management.</p>				
<p>BIONET® EROSION-CONTROL MATS Erosion control blankets composed of 100% organic, biodegradable agricultural straw or coconut fiber. Wildlife-friendly. Designed to last 12-24 months.</p>				
	2R1	North American Green Evansville, IN Retailer: ERO-TEX W62 N248 Washington Ave, Suite 205 Cedarburg, WI 53012 stores statewide	Tel: 800-772-2040 Tel: 866-437-6839 Fax: 262-387-1938	http://www.nagreen.com Email: customerservice@nagreen.com http://www.ero-tex.net Email: ero-tex@worldnet.att.net
<p>SILT SOCKS A tubular shaped fabric material that can be filled with shredded, clean wood scrap and/or compost for site erosion control.</p>				
		Packer Industries Mableton, GA Retailer: Purchase directly from manufacturer. Special equipment is required to fill the silt socks. For nearest WI silt sock filler, contact manufacturer (there are several statewide).	Tel: 800-818-2899 Fax: 404-505-1450	http://www.packer2000.com Email through website
<p>WOOD CHIPS Untreated, unpainted wood chips can be used for erosion control.</p>

STORMWATER MANAGEMENT

Encourages natural evaporation and infiltration, reduces stormwater runoff, and decreases pollutants into our lakes and rivers by limiting impervious surfaces and holding water on site.

GREEN ROOFS

Green roofs reduce stormwater runoff, cleanse water of pollutants, and extend life of roof membrane. For flat roofs and low-slope roofs.

AMERDRAIN® GREENROOF™ SYSTEM

Green roof system--provides aeration, drainage and water storage capacity. Carries RootShield, an optional top fabric that stops roots from entering the water-reservoir cones in the core to insure long-term water storage and unclogged drainage channels.

American Wick Drain Corporation
Monroe, NC

Tel: 800-242-9425
Fax: 704-238-0220

<http://www.americanwick.com>
Email: info@americanwick.com

Retailer:

Purchase directly from manufacturer.

CARLISLE ROOFTOP PLANTING SYSTEM

Green roof system composed of a waterproof roofing membrane, protection board, root barrier, drainage composite and moisture mat. For roofs with slopes less than 2" per foot. Does not include vegetation.

Carlisle Coatings & Waterproofing Inc.
Wylie, TX

Tel: 888-229-0199
Fax: 972-442-0076

<http://www.carlisle-ccw.com>
Email: info@carlisle-ccw.com

To navigate to this product, go to: Products / Waterproofing / Hot Rubber Membrane

Distributors:

Contact manufacturer for nearest distributor.

GARDEN ROOF®

Green roof system composed of a waterproof rubber roofing membrane made of at least 25% recycled content, root barrier, CFC-free styrofoam insulation/air barrier, moisture retention mat, drainage retention cups made of 100% recycled polyethylene, filter fabric and vegetation.

American Hydrotech, Inc.
303 E. Ohio Street
Chicago, IL 60611

PRODUCT NAME & DESCRIPTION

	REF #	NAME & ADDRESS	TEL & FAX	WEBSITE & EMAIL
GREEN ROOF BLOCKS Blocks made of lightweight aluminum trays for use in green roofs. Contain live plants and growth media selected for local climate. Pad attached under the tray elevates it off the roof allowing water and air to move freely under the system. Works on slopes up to 4:12. Available in 2ft x 2 ft blocks in depths of 4", 8", and 12"; compatible with all roof membranes.		Saint Louis Metalworks Co. Florissant, MO	Tel: 314-972-8010 Fax: 314-972-8182	http://www.greenroofblocks.com Email: kelly@saintlouismetallworks.com
		Retailer: Purchase directly from manufacturer.		
GREENGRID® SYSTEM Green roof system composed of recycled plastic modules containing growing medium & vegetation. Reduces stormwater runoff by absorbing rainwater (99% of 1" rainfall).		Weston Solutions, Inc. 20 N. Wacker Drive Chicago, IL 60606	Tel: 312-424-3319 Fax: 312-424-3330	http://www.greengridroofs.com Email: greengridroofs@westonsolutions.com
		Retailer: Purchase directly from manufacturer--they will deliver and install.		
GREENTECH ROOF GARDEN SYSTEM Green roof system composed of 46" square plastic modules which act as the drainage base--they take the place of a drainage medium, filter blanket and planting medium.		GreenTech Roswell, GA	Tel: 804-363-5048 Fax: 770-587-2445	http://www.greentechitm.com Email: info@greentechitm.com
		Installer: Contact GreenTech's Midwest rep: Tom Houlihan Tel: 877-264-4471		
J-DRAIN® GREEN ROOF SYSTEM Green roof underlay composed of plastic modules, for storing water while allowing excess through. Two layers of geosynthetic fabric act as a root barrier and filter fine particles. Available in 4ft. wide 50ft. rolls.		JDR Enterprises, Inc. Alpharetta, GA	Tel: 800-843-7569 404-918-2900	http://www.j-drain.com Email: info@j-drain.com
		Retailer: Purchase directly from manufacturer.		
RAIN CHAINS Alternatives to gutter downspouts that use less material and are aesthetic; of particular note for houses without gutters. For maximum impact, have rain chain drain into a rain barrel, rain garden, or catchment system. Below is listed one online retailer of rain chains made of recycled copper - many other types and styles can be found in a web search.				
HERBERT IMPORTS COPPER RAIN CHAINS Two styles of rain chains made from recycled copper.		Slate and Copper Sales Co. Erie, PA	Tel: 814-55-7430 Fax: 267-200-0800	http://www.slateandcopper.com Email: sales@slateandcopper.com
		Retailer: Purchase directly from manufacturer.

DECKING AND PLASTIC LUMBER			
<i>Products range from: Pressure treated wood that is chemically treated to retard rot and insect damage (Note: traditionally used CCA-treated lumber containing arsenic was banned from manufacture in the US as of January 2004 though it might still be sold), to sustainably harvested, naturally rot-resistant wood, to plastic lumber made wholly from plastic or with a mix of plastic and waste wood fiber. Plastic lumber products are made with varying amounts and types of recycled plastic from consumer and other sources. Suggested categorization of environmental attributes of these products is reported in The Healthy Building Network's Guide to Plastic Lumber, June 2005. http://www.healthybuilding.net/pdf/qtpl/guide_to_plastic_lumber.pdf</i>			
Preserve-Treated Wood

DIVISION 7: THERMAL AND MOISTURE PROTECTION

Insulation is placed in 3 main areas: attic, walls and foundation walls. Energy efficiency of your house envelope is also impacted by window performance and air leakage (around framing joints, windows & doors, outlets, can lights, etc.). Energy performance targets might include insulation values of R40 attic, R20 walls and R5 foundation walls, with windows at U value of 0.35 or less, and minimal air leakage.

INSULATION

BATT INSULATION

BAMBOO FLOORING

Flooring made from Chinese grass that matures in four to five years. Hard as oak or maple. Install as a tongue and groove wood floor, just nail differently: 8" from end.

BAMBOO MOUNTAIN™ FLOORING

Bamboo flooring made from FSC-certified Moso bamboo. Uses no-VOC, formaldehyde-free glues. Line includes bamboo flooring along with trims, such as matching heater-vent covers, baseboards, and stair treads and risers.

PRODUCT NAME & DESCRIPTION	REF # NAME & ADDRESS	TEL & FAX	WEBSITE & EMAIL
<p>CARPETING AND RUGS Look for carpets that don't off-gas (CRI GreenLabelPlus Certified or Sustainable Textile certified); have natural backing of hemp, jute, cotton, or natural fiber; or choose natural padding of jute, camel hair, mohair, natural wool or less-expensive recycled fiber. Choose natural wool carpet devoid of toxins. Tackstrips preferable to adhesives (a green adhesive choice is carpet squares with nontoxic adhesives for spot replacement). Have carpet aired before installation. Vacuum weekly with HEPA filtration vacuum.</p>			
<p>DESIGN MATERIALS NATURAL FLOOR COVERINGS Line of floor coverings made of natural, renewable materials such as sisal (hand-woven rope made from plant fiber), reeds (seagrass and mountaingrass), wool (woven and tufted), and coir (from coconut husks). Non-toxic and no off-gassing.</p>	<p>Design Materials, Inc. See 9M18, Kansas City, KS</p> <p>Retailers: 75 retailers statewide (mostly flooring and interior design stores). For nearest retailer, contact manufacturer.</p>		
<p>EARTH WEAVE WOOL CARPET AND PADDING Wool carpet (Bio-Floor™) and padding (Enertia™). Carpet backed with hemp and jute, natural adhesives and pigments used; biodegradable.</p>	<p>Earth Weave Carpet Mills, Inc. Dalton, GA</p> <p>Retailer: Family Organics 2701 University Av. DIVISION 11: EQUIPMENT

ENERGY STAR® APPLIANCES

Energy Star® appliances reduce water and electric/gas use and save money. They meet the standards of Energy Star®, a government-backed energy-efficiency program. They are available at many local retailers. Visit Focus on Energy's website: <http://www.focusonenergy.com> to locate nearest retailer, search for special offers on Energy Star® products, read about additional Energy Star® products, and read tips for improving energy efficiency. Also visit Energy Star®'s website: <http://www.energystar.gov> for a listing of Energy Star® appliance manufacturers.

CLOTHES DRYERS

Clothes dryers--the second most energy-consuming household appliances--aren't required to display Energy Guide labels, making it difficult to compare different models' energy efficiency. Look for a dryer that removes moisture more efficiently, has moisture sensors, and has automatic shut-off controls to avoid over-drying. Hanging clothes to dry is the best option for the environment and your pocketbook.

CLOTHES WASHERS

Energy Star® clothes washers save an average of up to 25 gallons of water per load or 40% less water than conventional washers. They save money by using 50% less energy per load, using less detergent per load, and spinning clothes drier, making it cheaper to run the drier. The water saved every year by using an Energy Star® qualified clothes washer instead of a new non-Energy Star® model is enough to do an entire year's worth of laundry and is as much as an average person drinks in a lifetime.

DISHWASHERS

Energy Star® dishwashers use a minimum of 25% less energy and 44% less water than conventional models. Because they use less hot water compared to conventional models, an Energy Star® dishwasher saves about \$100 over its lifetime.

FURNACES

Energy Star® furnaces have an annual fuel utilization efficiency (AFUE) rating of 90% or greater, making them about 15% more efficient than standard models.

REFRIGERATORS

Refrigerators are the single biggest energy consumer in most households. Energy Star® refrigerators require about half as much energy as models manufactured before 1993. They use at least 15% less energy than required by current federal standards, and 40% less energy than the conventional models sold in 2001. Replacing a refrigerator bought in 1990 with a new Energy Star® model would save enough energy to light the average household for more than four and a half months.

DIVISION 13: SPECIAL CONSTRUCTION

RENEWABLE ENERGY

Renewable energy is derived from resources that are regenerative or for all practical purposes cannot be depleted. Renewable energy can provide electricity, hot water and space heating for homes. Proven renewable energy technologies include solar, wind and biomass. The Midwest Renewable Energy Association (MREA) <http://www.the-mrea.org> shares ideas, resources, and information on renewable energy and energy efficiency to promote a sustainable future. The MREA promotes renewable energy through education and demonstration via their Renewable Energy and Sustainable Living Fair, ReNew the Earth Institute, Workshops, and tour of Solar Homes and Businesses. They work with the state Focus on Energy Program detailed below.

SOLAR ENERGY

SOLAR HOT WATER HEAT

Uses the sun's thermal energy to heat domestic water.

FOCUS ON ENERGY RENEWABLE ENERGY ASSISTANCE

Focus on Energy provides phone assistance, on-site assessments and financial incentives to offset capital costs. Contact Focus on Energy for a list of installers statewide (including certified) or download at: <http://www.focusonenergy.com/page.jsp?pagelid=1510&> Alternatively, contact your local utility (some areas are not in FoE territory).

HOUSEPLANTS

Natural plants provide bio-based air cleansing. Plants absorb and metabolize CO2 and airborne organic chemical pollutants while providing oxygen.

DEHUMIDIFIERS

All home dehumidifiers should carry the Energy Star label. If using in the basement, be sure to look for a model that has a thermostatic expansion valve or is rated to run at the lower temperatures.

APRILAIRE® 1700

Whole house dehumidifier. Electronic control and integrated air cycling feature balances indoor conditions. Can be installed to pull humidity from whole house, a separate living area or both.

<p>Retailer: Purchase directly from manufacturer or online via manufacturer's website</p>				
<p>CEILING FANS</p>				
<p>ENERGY STAR® rated ceiling fans move air up to 20% more efficiently than standard ceiling fans. This can save you from \$15-25 per year on utility bills, plus any additional air conditioning or heating savings you may gain when your fan is operated properly. If your fan doesn't include lighting and you'd like to add it, be sure to purchase an ENERGY STAR® qualified light kit. ENERGY STAR® fans are available at many home improvement and hardware stores.</p>				
<p>Purifan Circular ceiling fan unit that also helps remove unhealthy air contaminants. It uses a three-stage filtration system: a pre-filter, charcoal filter and a HEPA (High Efficiency Particulate Air) filter without increasing energy use.</p>	<p>Heartland Technologies, Inc. DIVISION 16: ELECTRICAL

LIGHTING

COMPACT FLUORESCENT LIGHTS

Compact Fluorescent light bulbs with electronic ballasts last more than 13 times longer than standard incandescents and use a fourth of the electricity. Available at many hardware, houseware and lighting stores. Choose bulbs with 1/4 of the wattage than the wattage you would use in a traditional incandescent bulb. Look for full spectrum lights and filters for indoor use. Some CFLs can be used with 3-way lamps and some with dimmers. Brands such as Philips, GE, Sylvania.

ALTO® PL-T 4 PIN CFL

Compact fluorescent light with lower mercury content and longer-life than standard CFLs. Can be disposed of conventionally because of low-mercury content.

Glossary

Agricultural products are made from fibrous biomass generated as a by-product of an agricultural crop that can be reclaimed for a secondary use not related to the original agricultural function (sometimes referred to as **agrifiber**). Examples of reclaimed agricultural waste materials include rice, wheat, sorghum and grass straw.

Biobased materials are produced through sustainable agricultural practices as well as natural fibers like cotton and wool. Biobased manufacturing processes generate by-products that are not hazardous, can be reused and are disposed of through biodegradable methods. This helps to enhance environmental quality and natural resources including local watersheds, native vegetation, habitat and forest ecosystems; reduces and eliminates toxic substances; reduces release of green house gases; and reduces reliance on non-renewable resources and increases use of renewable resources and energy.

Biodegradable "Reliable scientific evidence that the entire product or package will completely break down and return to nature, *i.e.*, decompose into elements found in nature within a reasonably short period of time after customary disposal (16 C.F.R. § 260.7 (b))."

Certified wood is wood that was harvested from a forest managed in a manner that fosters cycling of resources, promotes ecological balance, and conserves biodiversity. **Forest Stewardship Council (FSC)** has an internationally recognized certification system originally created by a global membership of forest product companies, environmental groups and sociologists with the intent to protect tropical forests. It is a performance based standard that focuses on ecological and social aspects of sustainability. Green Tag, another system, focuses on traditional forestry aspects of management. Both require verified conformance with 50 or more indicators. The US American Forest and Paper Association (AF&PA), an industry trade group, has its own certification called Sustainable Forestry Initiative (SFI) that is systems-based. Green Tag and SFI are considered aligned with landowners and the forestry industry. FSC is considered more independent and is supported by environmental organizations. Products listed in this directory are FSC certified products. See *FSC*.

CFCs, HCFCs chlorofluorocarbons and hydrochlorofluorocarbons are chlorine-containing gases that are confirmed ozone depleting substances. The ozone layer (located 7-10 miles above the earth's surface) helps to protect the earth and its inhabitants from the sun's damaging ultraviolet-B rays that can cause skin cancer, eye damage and immune system suppression. CFCs and HCFCs are used in heating, ventilation and air conditioning systems.

Cistern refers to a water holding tank that is typically used to store collected rainwater. Cisterns can be either buried or above-ground.

Clean energy refers to renewable energy—energy that comes from the sun, as well as some of the fossil fuel technologies which have particularly low emissions.

For example, the new generation of advanced gas turbines have much lower emissions levels than other fossil fuel technologies.

Closed loop recycling is a process whereby materials are reused in the original production process and are not lost or released into the environment. They are recycled into the same end product, such as reclaimed carpet recycled back into carpet. This contrasts to **open loop recycling** (also called **down-cycling**) where the materials are reclaimed and used in a different process and into a different end product. Examples of open loop recycling are reclaimed carpet made into plastic bumper stops in parking lots, and plastic soda bottles recycled into carpet (rather than back into soda bottles).

Compact Fluorescent Light bulb (CFL) is a small fluorescent bulb designed to replace the less energy efficient incandescent bulbs traditionally used for most residential purposes. CFLs are a similar size, approximately four times as energy-efficient, and 8-12 times as long lasting so they cost less to use.

Compostable materials in a product or package that break down into compost - soil or mulch, through a natural composting process (back yard or municipal composting).

Construction and demolition materials (C&D debris) include all non-hazardous solid resources resulting from construction, remodeling, repair and demolition operations.

CRI (Carpet & Rug Institute) is the national trade association representing the carpet and rug industry including manufacturers and suppliers of raw materials and services to the industry. **Green Label Plus** is an independent testing program that identifies carpets with very low emissions of volatile organic compounds (VOCs). It is an enhancement to the CRI [Green Label Testing Program](#) developed in 1992. Green Label Plus sets the standard for good indoor air quality helping customers to purchase the lowest emitting products on the market. CRI also has a "Green Label" testing program for vacuum cleaners to help protect indoor air quality. <http://www.carpet-rug.com>

Dark skies initiative aims to educate about the detrimental effects of light pollution and to publicize solutions. Light pollution obscures views of the night sky for people, telescopes and migrating birds, causes glare, and wastes energy. The most practical solutions for good lighting design use efficient fixtures and put light only where it is needed, lighting surfaces, not volumes.

Deconstruction is construction in reverse: dismantling buildings in part by hand and saving the materials to be used again through reuse and recycling instead of sending them to the landfill. This is in contrast to demolition where buildings are quickly collapsed into a heap of mixed waste that is sent to landfills.

Durable a product that lasts longer and performs better compared with other products that perform the same function.

Ecosystems are communities of organisms and their environment that function together as a whole. An ecosystem can be large (a whole forest) or small (a pond).

EnAct For Homes creates Environmental Action Teams in neighborhoods, community organizations and workplaces empowering Madison area and Dane County residents to take actions in their daily lives to reduce the environmental impact of their households. <http://www.enactwi.org>

Energy conservation is using less energy. This can be a result of an energy efficient technology or life style change. Examples include turning off lights when leaving the room, riding your bicycle to work, and programming the thermostat to a few degrees lower in the winter and higher in the summer.

Energy efficiency is providing better services with less energy, or doing more with less. Energy efficiency measures include superinsulating your house and using Energy Star appliances.

ENERGY STAR® is a program run by the US Environmental Protection Agency. It certifies appliances and homes that meet strict energy performance standards. It also offers tools and resources to plan home improvements for energy efficiency. EPA's Energy Star® program has a host of technical and marketing tools to assist you in saving energy and saving money. <http://www.energystar.gov>

Engineered wood products use less wood for equal or greater load bearing properties. They include materials recovered from timber mills (as opposed to recycled material) These products include glulams, laminated trusses, I-joists, laminated veneer lumber and oriented strand board (OSB) see *OSB*. Glues make up a significant portion by weight of these products. Green engineered wood products contain glues and adhesives that are water based (non- formaldehyde containing glues) that don't offgas so as not to cause harmful health impacts (see *Offgasing*).

Environmentally friendly a nebulous term often used to market products but that creates confusion in the marketplace. When used without specific data to back it up, the term is considered "greenwashing" or not an indication that a product is, in fact, good for the environment over its lifecycle. Look for certification of claims through an independent environmental certification service or by contacting the manufacturer's technical department.

Fly ash is a byproduct of coal-fired power plants. Fly ash is being used as recycled content in drywall and cement products. Replacing virgin materials with this recycled material saves considerable energy in manufactured products.

Focus on Energy is a public-private partnership between utilities and the State offering energy information, services and financial incentives to energy utility customers throughout Wisconsin. The goals of this program are to encourage energy efficiency and use of renewable energy, enhance the environment, and ensure the future supply of energy for Wisconsin. <http://www.focusonenergy.com>, 1 800 762-7077.

Formaldehyde, a common ingredient in glues and binders (such as in particle board), is classified by the International Agency for Research on Cancer (IARC) as a “probable human carcinogen” and listed by the U.S. National Toxicology Program as “reasonably anticipated to cause cancer.” See *Offgasing and VOCs*

FSC (Forest Stewardship Council) (see *Certified wood*) is an independent, international, membership-based organization that brings people together to promote responsible management of the world's forests through developing standards, a certification system and trademark recognition. Forest management operations that meet the FSC principles and criteria for environmental, economic, and social standards are awarded the certification seal. Operations that purchase and sell FSC-certified products can achieve certification when they meet Chain-of-Custody standards. The FSC label, which establishes a direct tie between the forest and products consumers use, gives companies a marketplace niche that is of increasing appeal to consumers concerned about the environment and the rights and welfare of workers and communities. <http://www.fsc.org>

GREENGUARD Certified Products have passed a series of rigorous emission tests for levels of total particles, formaldehyde, and other Volatile Organic Compounds (VOCs) and undergo quarterly monitoring tests to provide ongoing assurance of their low emitting status. Standards are based on emission levels used by the US Environmental Protection Agency, the State of Washington, and the LEED-CI program. <http://www.greenguard.org>

Green building or sustainable design is a whole building integrated design and construction approach that optimizes the site and energy, water and materials efficiency, and improves indoor environmental quality and occupant comfort.

Green housekeeping (nontoxic chemical use) represents the development of new technologies that allow for cost-effective cleaning, while at the same time further reducing the risk of harm to both people and the environment.

Green roof is simply a roof planted with vegetation. In cities where open space is scarce, green roofs provide a holistic solution to a range of concerns: stormwater runoff, urban heat island effect, air pollution, noise mitigation, habitat and green space creation, and aesthetics.

Green Seal is an independent, nonprofit organization dedicated to protecting the environment by promoting the manufacture and sale of environmentally responsible consumer products. It sets life cycle-based environmental standards and awards a "Green Seal of Approval" to products that cause less harm to the environment than other similar products. By setting standards for environmentally responsible products, Green Seal seeks to reduce air and water pollution; cut the waste of energy and natural resources; slow ozone depletion and the risk of global warming; prevent toxic contamination; and protect fish and wildlife and their habitats. <http://www.greenseal.org>

Greenhouse gas (GHG) is the term used to describe the category of gases that enhance the earth's natural greenhouse effect, causing global warming. GHGs are the six gases listed in the **Kyoto Protocol**: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and

sulphur hexafluoride (SF₆). Carbon dioxide (CO₂) from fossil fuel combustion comprises the majority of GHG emissions worldwide. The US produces 20.6% of the world's GHGs, more than any other nation (PEW Center on Global Climate Change, December 2004). The Kyoto Protocol of the International Convention on Climate Change requires listed developed nations to meet reduction targets of GHG emissions relative to their 1990 levels during the period 2008-12. The potential consequences of global climate change include rising sea levels leading to coastal floods, severe droughts, heat waves, and disease migration, affecting communities and the economy worldwide.

Greywater is all “slightly used” water from the home, including sink, dish, laundry, and shower water. After minimal filtering, greywater can be reused for other purposes, including irrigation and toilet flushing. This helps to reduce strain on sewer and septic systems and reduce use of drinking water. When used for irrigation, the nutrients found in greywater act as a fertilizer for plants.

HDPE (high density polyethylene plastic) is typically recycled from household milk and laundry detergent plastic containers and used as recycled content in a variety of building materials such as recycled plastic lumber.

Indoor environmental quality includes issues related to indoor air quality (ventilation effectiveness, carbon dioxide monitoring, and control of contaminants-using non-toxic or low toxic and low-emitting materials and chemicals) as well as lighting levels, acoustics and humidity. Quality of indoor environments has significant impacts on health, productivity and quality of life. See *VOCs and Offgasing*.

Infill development occurs within urban areas instead of expanding out into undeveloped land. This helps to increase density, keep people closer to municipal infrastructure, reduce pollution associated with driving, and protect green spaces around urban areas.

Insulated Concrete Form (ICF) is a concrete wall enclosed in insulated foam building forms. The forms interlock and are filled with concrete resulting in a nearly fireproof wall with high insulation value, sound-dampening qualities, and insect-resistance. ICFs are used as an alternative to wood studs and traditional walls.

LED lighting is a technology that uses light-emitting diodes (LEDs) in place of incandescent or fluorescent lighting. LEDs are highly efficient and can last 1,000 times as long as incandescent bulbs, greatly reducing maintenance costs. For this reason, they are being employed today in many traffic signals and exit signs. Though currently more expensive than other lighting types, they are expected to become cost-competitive within a few years.

LEED™ accredited professionals are experienced building industry practitioners who have demonstrated their knowledge of integrated design and their capacity to facilitate the LEED™ certification process on the LEED™ Professional Accreditation exam. The accreditation program recognizes expertise in green building and LEED™ to help meet the growing demand from the public and private sectors for green buildings. <http://www.usgbc.org/leed>

LEED™ Green Building Rating System has been adopted nationwide as the guideline for sustainable building by federal agencies, state and local governments, and interested private companies. LEED™ (Leadership in Energy and Environmental Design) is a feature-oriented rating system where credits are earned for satisfying specified green building criteria. The five major environmental categories of review include: Sustainable Sites, Water Efficiency, Energy and Atmosphere, Materials and Resources, and Indoor Environmental Quality. Certified, Silver, Gold, and Platinum levels of green building certification are awarded based on the total credits earned. There are LEED™ standards for new commercial construction, existing buildings and commercial interiors with standards for residential and others in development. <http://www.usgbc.org/leed>

Life cycle assessment (LCA) is an attempt to quantify and characterize all the significant environmental inputs and outputs associated with a product over its entire life cycle. **Cradle to grave** (extraction through disposal) or **cradle to cradle** life cycles (natural cycle- nutrient metabolized into nutrient or technical material recirculated in industrial process) span impacts on land, water, energy, air, and resources from raw materials mining and harvesting, to transportation, manufacturing, use (reuse), disposal or composting. There are computer modeling tools that assist in this analysis including Building for Environmental and Economic Sustainability (BEES) life-cycle assessment software, developed by the National Institute of Standards and Technology (NIST),

Life cycle cost (LCC) shifts budgeting focus for buildings from first cost (what it costs to design and build) to a total life cycle cost analysis. By shifting to building life-cycle costing and assessment rather than separating construction budgets (first costs) from operational budgets, decision-makers will have a realistic cost comparison of the actual long-term cost of a building.

Low-e (low-emissivity) coatings increase the R-value from 2 to 3 of standard double-glazed windows. Typically, inert argon gas that slows the conduction of heat and cold fills the space between the layers of glass. Use low-e coatings on east and west windows only, not on south windows where solar gain is beneficial.

Low Impact Development (LID) is an innovative stormwater management approach with a basic principle that is modeled after nature: manage rainfall where it falls using uniformly distributed decentralized micro-scale controls (e.g. bio-swales). LID's goal is to mimic a site's predevelopment hydrology by using design techniques that infiltrate, filter, store, evaporate, and detain runoff close to its source.

Mixed use is a type of development that combines residential, commercial, and/or office uses, into one development or building. This type of development accommodates a human-scaled community where a person can get to the store, work, and entertainment on foot.

Non-attainment zone for air quality is a label placed on areas where air pollution levels persistently exceed the national ambient air quality standards by the EPA. Regions that continue to achieve non-attainment status may be denied Federal assistance if the acceptable air quality is not achieved.

Non-toxic refers to products that do not emit gases that are harmful or poisonous and are not made of toxic substances.

Offgassing is the release of gases from a material or product into the air. Indoor air quality and human health are affected by many chemicals including formaldehyde and VOCs that are offgassed from building materials and finishes. Depending on the product, offgassing occurs at varying concentrations and over varying time periods ranging from days to years. Emission rates typically decrease over time. It is best to air products that might emit harmful chemicals before bringing it into your house. Best yet, avoid using them.

Off the grid indicates that a building or development is not tied to the central power transmission system; and therefore produces all of its power on site. A correctly designed off the grid system insulates the building community from fuel price volatility and grid instability.

Organic production is a production system that is managed in accordance with The Organic Foods Production Act of 1990, as amended (7 U.S.C. 6501 et seq.), to respond to site-specific conditions by integrating cultural, biological, and mechanical practices that foster cycling of resources, promote ecological balance, and conserve biodiversity.

OSB or oriented strand board is an engineered wood fiber product made from a feed stock that is basically waste plant fiber using many or any sources. It varies from **particle board** in that the fibers are not chipped and homogeneous, but are 'oriented' in a way that the structural properties provide predictable performance qualities.

PAH (Polynuclear aromatic hydrocarbon) is a carcinogenic hydrocarbon in coal tar typically contained in asphaltic products.

Photovoltaics (PV) are a source of clean renewable energy that converts the sun's light energy into electricity. Peak PV output usually coincides with the large mid-day demand loads, making it an effective way to reduce strain on the electrical grid. Property value added by PV systems is tax-free in Wisconsin.

Precautionary Principle Where threats of serious or irreversible harm to people or nature exist, anticipatory action will be taken to prevent damages to human and environmental health, even when full scientific certainty about cause and effect is not available, with the intent of safeguarding the quality of life for current and future generations.

Precycling making purchasing decisions that will reduce waste such as buying products that will last longer, are not single use disposals or with less packaging.

PVC polyvinyl chloride, commonly known as "vinyl," is one of the most common synthetic materials that appears in a myriad of configurations from toys and car parts to vinyl siding and flooring, though predominately used in the construction industry. PVC is a toxic problem because numerous persistent toxins are used, created and released throughout the PVC life-cycle. Dioxin and vinyl chloride are released during the production process that can cause severe health problems from

cancer to reproductive and immune system damage. PVC is more than 50% chlorine by weight-- a persistent toxic pollutant that stays in the environment; and, the plasticizers added to make it flexible are endocrine-disrupting chemicals that bioaccumulate in the human population and other organisms. The health care industry is eliminating it from use as are many innovative industries.

Raingardens are an integral part of a stormwater management system. They are designed to capture and retain stormwater runoff instead of whisking it away into a conventional gutter system. Using a vegetated raingarden allows the water to naturally percolate into the aquifer system; replenishing the ground water source.

Reclaimed or recovered material would otherwise have been disposed of as solid waste or used for energy recovery, but has been collected and recovered as a feedstock material in place of a virgin material for recycling or manufacturing.

Recycled Content is the proportion, by mass, of recycled material in a product or packaging. Only pre-consumer and post-consumer materials are considered as recycled content (*see Recycled products*).

Recycled products contain materials that have been recovered or otherwise diverted from the solid waste stream either during the manufacturing process (**pre-consumer or post industrial**), or after consumer use (**post consumer**). The materials have been processed, treated or reconstituted so that they can be used again as a feedstock. To the extent the source of recycled content includes pre-consumer material, the manufacturer must have substantiation that the pre-consumer material would otherwise have entered the solid waste stream. In asserting a recycled content claim, distinctions may be made between pre-consumer and post-consumer.

Recycling is the process of collecting, sorting, cleaning, treating and reconstituting materials that would otherwise become solid waste, and returning them to the economic mainstream in the form of raw material for new, reused or reconstituted products. In many instances, recycling saves energy, water and pollution by avoiding the impacts of harvesting, mining, and shipping virgin materials to make a product.

Renewable energy is derived from resources that are regenerative or for all practical purposes cannot be depleted. Renewable energy can provide electricity, hot water and space heating for homes. Proven renewable energy technologies, such as solar, wind and biomass provide power sources that can improve the reliability and security of the existing electricity grid, while decoupling energy cost from rising energy costs of natural gas. It also reduces harmful environmental and health impacts of utility energy production from fossil fuels, creates high quality local jobs, and reduces Wisconsin's energy imports. Buildings and infrastructure with an optimal combination of energy efficient and renewable energy strategies can enjoy lower life cycle costs.

Renewable materials can be regenerated such as bamboo grasses and trees. Bamboo is also referred to as **rapidly renewable** as it can replace itself within five years.

Resource efficient products use less material than similar products that provide the same function.

Reused products are recovered for uses similar or identical to their originally intended application without being remanufactured. Reused, salvaged and refurbished products are considered to have fewer environmental impacts than recycled products because of the energy and pollution saved by not having to remanufacture them.

Salvaged Material is generated from building deconstruction activities that is reused without having to be remanufactured. Also applies to abandoned material retrieved from submerged sites (e.g., lake bottoms). Even though salvaged timbers are sometimes milled into flooring, they are still considered salvaged.

(SCS) Scientific Certification Systems is an independent third party certifier of multiple facets of the food industry and of the environmentally sound management of forests, marine habitats, and a wide variety of manufacturing-related businesses. Specific product attributes, such as recycled content and biodegradability, are certified under the Environmental Claims Certification program. SCS also certifies **environmentally preferable products**, which are products or services that can demonstrate a reduced or lessened environmental impact when compared to other products performing the same function. Products are evaluated on the basis of life-cycle impact assessment. <http://www.scs-certified.com> See *Life cycle assessment*

Sick building syndrome (SBS) is used to describe any acute health or comfort effects that appear to be linked to time spent in a building. Americans are estimated to spend 90% of their lives indoors allowing SBS to take a considerable toll on the occupant's health. Several of the primary causes of SBS, including chemical and biological contaminants and improper ventilation, are linked to both building design and material selection. See *VOCs*.

Slag is a byproduct of steel manufacturing. Formerly disposed of as waste, slag is now used as a recycled-content feedstock to concrete replacing a portion of the Portland cement. Cement is an energy intensive material. Using recycled content reduces the energy profile of manufacturing this product as well as replacing use of virgin materials.

Smart Growth is a development strategy intended to discourage sprawling developments by promoting healthy communities that encourage economic development and jobs through the creation of strong neighborhoods with transportation choices. Smart Growth initiatives typically favor policies that strengthen the existing infrastructure over those that extend it to service sprawl.

SmartWood is a program of the Rainforest Alliance, a global nonprofit conservation organization that is the world's leading nonprofit forestry certifier. SmartWood is accredited by the [Forest Stewardship Council](http://www.fsc.org) (FSC), and provides third-party certification and auditing services. <http://www.smartwood.org>

Solar hot water heating (SHWH) systems use the sun to heat water for home hot water needs including showers, dishwashing, clothes washing, and cooking. A solar hot water system connects to the existing gas or electric water heating

system, providing a supplemental source of heat for up to 60% of hot water needs. SHWH can be used for radiant or forced air heat as well. SHWH's only visible component is the solar collector which can be integrated into a building's roof to resemble a conventional skylight. Focus on Energy offers technical assistance with and a rebate on installation of SHWH for residents whose utilities are members of the Focus program. See *Focus on Energy*

Structural Insulated Panel (SIP) these systems are a material and labor saving alternative to traditional stick construction methods. Each panel provides a thermally efficient wall as it is uninterrupted by studs. They are custom manufactured to size reducing job site waste. SIPs are typically used as wall panels, both load-bearing and non load-bearing, though they can be used for floors and roofs.

Sustainability means meeting today's needs without compromising the ability of future generations to meet their own needs. A sustainable development is a development whose patterns of production and consumption can be reproduced indefinitely without doing irreparable damage to essential natural ecosystems. Sustainable development is achieved through adhering to the triple bottom line; environment, economy and social equity.

Sustainable Textile Standard® provides a market-based definition for Sustainable Textile (carpet, fabric, apparel), establishes performance requirements for public health and environment, and addresses the triple bottom line, economic-environmental-social, throughout the supply chain. The Standard is based on life cycle assessment (LCA) principles, and provides benchmarks for continuous improvement and innovation. STS was developed through MTS, a nonprofit that brings together products manufacturers, environmental groups, and key state and local government leaders using market mechanisms to increase sales and market share of sustainable products & subsequent global benefits. See Unified Sustainable Textile Standard: <http://mts.sustainableproducts.com/standards.htm>

Swale is a gently sloping, vegetated depression in the land which can be used to transport storm water. The vegetated lining of the swale slows and filters the storm runoff, avoiding some of the non-point source pollution associated with typical impervious storm water systems.

The Triple Bottom Line refers to community, environment and economy. By enhancing human culture, well-being and productivity, protecting or enhancing the natural environment and providing economic advantage through lower life cycle costs, green development protects the triple bottom line.

Urban Heat Island Effect (UHIE) refers to the 2-10+ degree temperature increase in urban areas that is caused by replacing natural vegetation with dark asphalt and concrete for roads, buildings, and parking lots. This increases the formation of atmospheric smog, can negatively affect human, plant and animal health, and increase energy use and costs for cooling. Heat islands can be reduced by choosing high-albedo (reflective) roofing and green roofs, light colored construction materials for roads, driveways, and other paved surfaces, and by planting shade trees near buildings and roads.

VOCs (volatile organic compounds) are organic compounds that have sufficiently high vapor pressures to exist as gases or vapors at ambient temperatures. They contribute to outdoor (ground level ozone) and indoor air pollution. Exposure to VOCs may result in short- and long-term health effects and chemical sensitivities at concentrations typically measured in homes and offices. Short-term health effects can include irritation of eyes, nose, and throat, headaches, dizziness, and fatigue. Long term health effects, though not evidenced from residential and office levels of exposure, may include asthma and other chronic respiratory illnesses, reproductive effects, and cancer (source: EPA).

Most materials and products used in the construction and finishing of interior office spaces and residential buildings are potential sources of VOCs. Some of the higher-emitting materials include adhesives, vinyl floor coverings, and particleboard. Others include paints, sealants, caulks, carpets, wall coverings, composite wood products, drywall products such as taping compounds, concrete deck leveling compounds, furniture finishing products, and insulation materials. Furniture and interior panels are also likely VOC sources. Other sources of VOCs include heating, ventilating, and air conditioning (HVAC) systems, building maintenance and cleaning products, consumer products, combustion appliances and tobacco smoking. VOCs may absorb onto soft surfaces like fabric upholstery, carpets, insulation, wallboard, and other porous indoor materials where they become secondary sources that also release VOCs into the air over time. See *Offgasing*

Vermicomposting or worm composting is using worms to feed on slowly decomposing materials (like vegetable scraps) in a controlled environment to produce a nutrient-rich soil amendment.

Waste reduction is the combined efforts of waste prevention, reuse, composting and recycling practices.

WI Green Built Home is a voluntary green building initiative that reviews and certifies homes that meet sustainable building and energy standards. This statewide program is implemented in partnership with the Madison Area Builders Association in cooperation with other participating builders associations, leading utilities and organizations that promote green building. Homeowners (homebuyers) are encouraged to use the checklist and share it with your builder/remodeler. <http://www.greenbuilthome.org>

Xeriscaping is the practice of landscaping with slow growing, drought-tolerant plants.
