

HOW YOU CAN USE OUTDOOR LIGHTING BETTER

Contrary to popular thinking, bright glaring lights can actually *lessen* our ability to see well at night. *Shielded*, or *full cutoff* light fixtures reduce glare and improve our eye's ability to see surroundings after dark. Remember to use outdoor lighting *only when needed* to help preserve our natural night environment, *and save energy too!*

PREVENT BLINDING GLARE

Re-aim lights or use shielded outdoor lighting to help your eyes see better and more naturally at night

PREVENT LIGHT TRESPASS

Light your home or business without annoying the neighbors

PREVENT INTERFERENCE WITH NATURE

Do your best to keep lighting inside your property to avoid disturbing or attracting nearby wildlife

PREVENT LOSS OF THE STARRY SKY

Help reduce 'sky glow' by keeping your lighting on the ground - instead of up in the sky

PREVENT ENERGY WASTE

Whenever possible, use energy-efficient light fixtures, light bulbs, or motion sensors to conserve energy, reduce air pollution and SAVE MONEY TOO!
